

Vansh Thakur

SOFTWARE ENGINEER

New Delhi, India | +91-8375031206 | ✉ thakur.vansh723@gmail.com | **in** linkedin.com/in/vanshthakur |  github.com/DragoVeizen | leetcode.com/DragoVeizen

TECHNICAL SKILLS

Languages: PHP, Go, TypeScript, SQL
Backend: Laravel, Node.js, NestJS, MySQL, Redis, Elasticsearch, ClickHouse
Infra: Docker, AWS (ECR, S3), LocalStack, OpenSearch
Frontend: React, Next.js, Tailwind CSS
Testing: PHPUnit, Jest

EXPERIENCE

Hudle — *India's largest sports venue booking platform*

New Delhi

Full Stack Engineer (Full-time)

Aug 2024 – Present

- **Re-architected a financially-critical transaction pipeline** to support fine-grained, auditable state across dependent entities; migrated production with zero downtime via a phased rollout, with no data loss or revenue impact.
- **Shipped a new revenue stream end-to-end**, including a third-party provider integration with idempotent retries, a circuit breaker for sustained provider failures, and an async state machine for fault-tolerant fulfillment; **operating through multiple provider outages with zero revenue-path impact since launch.**
- **Tuned the Elasticsearch search pipeline** with custom analyzers and a flattened schema, substantially improving query performance and eliminating **90%** of mapping errors.
- **Built an internal audit analytics system** on Laravel + ClickHouse tracking model-level changes by user and role — giving ops and product teams a queryable history of who changed which venue settings, improving accountability and shortening incident triage.
- **Automated a one-command, production-mimic dev environment** (Docker + ECR images, LocalStack, OpenSearch, workers) with optional local code mounts, cutting onboarding from **4 days to 1 hour.**
- **Implemented a Redis-backed token bucket rate limiter** keyed on IP and device fingerprint, blocking abusive API traffic that bypassed user-level limits and reducing load on downstream services.
- **Built hudle.in**, the company's primary acquisition surface — programmatic SEO across **20+ cities and 40+ sports** on an image-optimized Next.js frontend, driving **~20k monthly organic sessions** and **300+ venue enquiries** alongside B2B funnels for venue partners and corporate clients.
- **Built a unified admin panel** with Google OAuth and role-based access control, consolidating multiple internal tools and cutting new-team setup time by **40%.**

Plotline

Bengaluru, Karnataka

Software Development Engineer Intern

Jan 2024 – Jun 2024

- **Migrated backend APIs from Node.js to Go**, restructuring I/O and database handling to reduce average response time by **30%.**
- **Built a media compression service** using FFmpeg and Sharp to optimize image and video delivery, handling **1000+ daily requests** across customer campaigns.
- **Developed a schema-driven drag-and-drop widget builder** with live preview, letting non-technical users self-serve in-app widget customization without engineering involvement.

PROJECTS

Keylytics — **Keystroke-Level Typing Analytics** | *TypeScript, React, Python, FastAPI*

- Open-source typing analytics tool that captures keystroke-level telemetry to surface hesitation patterns and per-bigram latency, going beyond standard WPM metrics.
- Designed a modular architecture separating the React data-capture client from a Python analytics engine computing n-gram latency and transition matrices; deployed live with a public demo.

EDUCATION

Jaypee Institute of Information Technology (JIIT)

Noida, India

Bachelor of Technology in Computer Science Engineering (CGPA: 8.0)

Sep 2020 – Jun 2024
